16. ABSTRACT
Annual total phosphorus and total nitrogen loadings to the lake were estimated and subdivded according to either point or non-point source origin. An assessment of the lake's trophic condition and limiting nutrient is also provided. All data collected by the U.S.E.P.A. National Eutrophication Survey during the one year study of the lake and its tributaries are included in the report.

FOREWORD

The National Eutrophication Survey was initiated in 1972 in response to an Administration commitment to investigate the nationwide threat of accelerated eutrophication to fresh water lakes and reservoirs.

OBJECTIVES

The Survey was designed to develop, in conjunction with state environmental agencies, information on nutrient sources, concentrations, and impact on selected freshwater lakes as a basis for formulating comprehensive and coordinated national, regional, and state management practices relating to point-source discharge reduction and non-point source pollution abatement in lake watersheds.

ANALYTIC APPROACH

The mathematical and statistical procedures selected for the Survey's eutrophication analysis are based on related concepts that:

a. A generalized representation or model relating sources, concentrations, and impacts can be constructed.

b. By applying measurements of relevant parameters associated with lake degradation, the generalized model can be transformed into an operational representation of a lake, its drainage basin, and related nutrients.

c. With such a transformation, an assessment of the potential for eutrophication control can be made.

LAKE ANALYSIS

In this report, the first stage of evaluation of lake and watershed data collected from the study lake and its drainage basin is documented. The report is formatted to provide state environmental agencies with specific information for basin planning [§303(e)], water quality criteria/standards review [§303(c)], clean lakes [§314(a,b)], and water quality monitoring [§106 and §305(b)] activities mandated by the Federal Water Pollution Control Act Amendments of 1972.

Beyond the single lake analysis, broader based correlations between nutrient concentrations (and loading) and trophic condition are being made to advance the rationale and data base for refinement of nutrient water quality criteria for the Nation's fresh water lakes. Likewise, multivariate evaluations for the relationships between land use, nutrient export, and trophic condition, by lake class or use, are being developed to assist in the formulation of planning guidelines and policies by EPA and to augment plans implementation by the states.

ACKNOWLEDGMENT

The staff of the National Eutrophication Survey (Office of Research & Development, U. S. Environmental Protection Agency) expresses sincere appreciation to the Connecticut Department of Environmental Protection for professional involvement and to the Connecticut National Guard for conducting the tributary sampling phase of the Survey.

John J. Curry, Director of the former Water Resources Commission; Roy B. Anderson, Principal Sanitary Engineer, and Steven Gerdsmeier, Sanitary Engineer, of the Water Compliance Unit, Department of Environmental Protection; and Sam Suffern, Assistant Director of Water and Related Resources, Department of Environmental Protection, provided invaluable lake documentation and counsel during the course of the Survey.

Major General John F. Freund, the Adjutant General of Connecticut, and Project Officer Lieutenant Colonel Daniel M. McGuire, who directed the volunteer efforts of the Connecticut National Guardsmen, are also gratefully acknowledged for their assistance to the Survey.

LAKES LILLINONAH, ZOAR, and HOUSATONIC

STORET NOS. 0911, 0910, and 0912

I. CONCLUSIONS

A. Trophic Condition:

1. Lake Lillinonah -

Lake Lillinonah is a eutrophic impoundment exhibiting high nutrient levels, severely depressed dissolved oxygen levels, and succession to a blue-green alga dominated flora as water conditions deteriorate through the summer. Considering the high light penetration noted and the absence of well-defined stratification, the impact upon dissolved oxygen is indicative of very high oxygen demand in the water and/or sediments.

2. Lake Zoar -

Lake Zoar is also eutrophic with depletion of dissolved oxygen, excessive nutrient levels, and high concentrations of blue-green algae in surface waters.

3. Lake Housatonic -

Lake Housatonic is a eutrophic impoundment with heavy growths of rooted aquatic vegetation in the shallows and high algae concentrations in the surface waters; consistently high nutrient levels and moderately depressed dissolved oxygen levels were noted.

B. Rate-Limiting Nutrient:

The three impoundments of the Housatonic River sampled were phosphorus limited at the time of sampling, as indicated by the results of algal assays performed on water samples from each. Control algae yields were substantial for Lakes Zoar and Lillinonah but relatively low for Lake Housatonic which is not directly impacted by point sources. The inorganic nitrogen: dissolved phosphorus ratios substantiate that the productivity of each impoundment was limited by phosphorus.

C. Nutrient Controllability:

1. Point sources--The phosphorus loading rates to these impoundments were from 9 to 12 times the rate proposed by Vollenweider (in press) as dangerous; i.e., a eutrophic rate (see pages 29 and 30). Point sources within the Survey area* accounted for about 30 percent of this load.

Major sources of phosphorus in Massachusetts result in stream concentrations nearly ten times higher than estimates for unimpacted local streams at the point where the Housatonic River crosses into Connecticut. Control of phosphorus at point sources within Connecticut alone is unlikely to improve the water quality of these three impoundments significantly. A

* See Working Paper No. 1, "Survey Methods".

cooperative effort to effect trophic improvement of these lakes would require essentially total phosphorus removal at the known point sources. In addition, a study of land use practices in the Housatonic River drainage basin might yield additional explanations for the high mean loadings noted for those tributaries sampled that have no known point sources.

Lakes Lillinonah, Zoar, and Housationic share short residence times, the absence of well-developed thermoclines, and phosphorus limitation of algal growth. Lake Lillinonah and Zoar reportedly possess strong phosphorus binding activity in their sediments. All of these factors favor potential trophic improvement. Control of carp populations in Lake Housatonic may aid in reducing resuspension of nutrient-rich sediments.

2. Non-point sources (see page 28)--With the exception of Lee Brook and Boys Halfway River, the phosphorus exports of the tributaries of the Housatonic impoundments were quite high during the sampling year. Particularly in the case of the Housatonic River, the high exports reflect the impact of point sources beyond the 25-mile limit of the Survey.

II. INTRODUCTION

1. Lake Lillinonah was formed in 1955 by the construction of the Shepaug hydroelectric dam approximately two miles downstream from the confluence of the Housatonic and Shepaug rivers. The lake winds scenically through a steep, forested valley. Shoreline development is light; a portion of the east shore is bounded by the George C. Waldo State Park. The Housatonic and Shepaug rivers provide the major water input to the lake. The Sympaug, Limekiln, Macedonia, and Still rivers make small contributions as do a number of minor tributary brooks.

Recreation and power generation are the primary uses of the lake. As a scenic attraction, as well as an excellent smallmouth bass fishery, the recreational potential of the lake appears to be good. However, despite the availability of public access, the lake is not subject to the use pressures that would be anticipated. Periodic massive algal blooms discourage full utilization of the recreational resources of the lake during certain times of the year.

2. Lake Zoar is an impoundment formed in 1919 by Stevenson Dam. The lake lies in an attractive steep-sided valley which is heavily forested. There is little shoreline development except at Cedarhurst, at the northwest end, and along a small strip just north of Stevenson. The land between includes the Paughsett State Forest on the west side and the Kettletown State Park on the east. The Housatonic River provides

the major water input to the lake. The Kettletown, Lee, Deep, and Transylvania brooks; and Halfway, Boys Halfway, Pootatuck, and Pomperaug rivers make lesser contributions to overall flow. Two good references on the nutrient budgets of lakes Lillinonah and Zoar are Frink (1970) and Norvell (1972).

3. Lake Housatonic, located in Fairfield and New Haven counties, is a narrow impoundment of the Housatonic River formed by a concrete dam just above Derby. Considerable silt accumulation covers sand, gravel, and rocks over much of the bottom. Heavy growths of rooted aquatic vegetation were noted in shallow coves, and emergents were present in shallow near-shore areas.

Heavy shoreline development and easy public access are found at Lake Housatonic. State and municipal parks extend along portions of each shore. Boating, fishing, and swimming are the primary recreational activities. Other water usage includes hydroelectric generation and industrial processing.

Carp are abundant, but gamefish and panfish are relatively scarce. Stocking of the waters has included salmon, chain pickerel, yellow perch, calico bass, bullheads, sunfish, and shiners.

All three of these lakes are discussed briefly in a fisheries survey published by the State Board of Fisheries and Game (Anonymous, 1959).

III. LAKE† AND DRAINAGE BASIN CHARACTERISTICS

A. Lake Lillinonah -

1. Lake Morphometry -

   a. Surface area: 1,900 acres.

   b. Mean depth: 38.9 feet.

   c. Maximum depth: 100 feet.

   d. Volume: 74,000 acre-feet.

   e. Mean hydraulic retention time: 17 days.

2. Tributary and Outlet -
   (See Appendix A for flow data)

   a. Tributaries -

Name	Drainage area*	Mean flow*
Housatonic River	1,194.0 mi^2	1,862.7 cfs
Shepaug River	148.0 mi^2	263.3 cfs
Minor tributaries & immediate drainage -	47.3 mi^2	86.8 cfs
Totals	1,389.3 mi^2	2,212.8 cfs

   b. Outlet -

Housatonic River	1,392.0 mi^2**	2,212.8 cfs

3. Precipitation*** -

   a. Year of sampling: 52.7 inches.

   b. Mean annual: 45.4 inches.

† Anonymous, 1972.

* Housatonic River impoundment drainage areas are accurate within ±1%; gaged mean daily and mean monthly flows are accurate within ±10%; ungaged mean daily and mean monthly flows are accurate within ±20%; and normalized mean monthly flows are accurate within ±10% for gaged streams and within ±12% (high flow) to 27% (low flow) for ungaged streams.

** Includes area of lake.

*** See Working Paper No. 1.

B. Lake Zoar -

1. Lake Morphometry -

   a. Surface area: 975 acres.

   b. Mean depth: 24.6 feet.

   c. Maximum depth: 75 feet.

   d. Volume: 23,985 acre-feet.

   e. Mean hydraulic retention time: 5 days.

2. Tributary and Outlet -

   a. Tributaries -

Name	Drainage area	Mean flow
Housatonic River	1,392.0 mi^2	2,212.8 cfs
Pootatuck River	26.1 mi^2	46.0 cfs
Halfway River	10.8 mi^2	19.5 cfs
Kettletown Branch	5.0 mi^2	9.2 cfs
Unnamed Stream (D-1)	1.8 mi^2	3.4 cfs
Lee Brook	1.1 mi^2	2.1 cfs
Boys Halfway River	0.7 mi^2	1.3 cfs
Minor tributaries & immediate drainage -	102.0 mi^2	183.0 cfs
Totals	1,539.5 mi^2	2,477.3 cfs

   b. Outlet -

Housatonic River	1,541.0 mi^2*	2,477.3 cfs*

3. Precipitation:

   a. Year of sampling: 66.5 inches.

   b. Mean annual: 47.6 inches.

* Includes area of lake; inflows adjusted to equal outflow.

C. Lake Housatonic -

1. Lake Morphometry -

a. Surface area: 328 acres.

b. Mean depth: 9.4 feet.

c. Maximum depth: 26 feet.

d. Volume: 3,083 acre-feet.

e. Mean hydraulic retention time: 15 hours.

2. Tributary and Outlet -

a. Tributaries -

Name	Drainage area	Mean flow
Housatonic River	1,541.0 mi^2	2,477.3 cfs
Minor tributaries & immediate drainage -	32.5 mi^2	57.8 cfs
Totals	1,573.5 mi^2	2,535.1 cfs

b. Outlet -

Housatonic River	1,574.0 mi^2*	2,535.1 cfs

3. Precipitation:

a. Year of sampling: 60.9 inches.

b. Mean annual: 45.6 inches.

* Includes area of lake.

IV. LAKE WATER QUALITY SUMMARY

Lakes Lillinonah, Zoar, and Housatonic were sampled three times during the open-water season of 1972 by means of a pontoon-equipped Huey helicopter. Each time, samples for physical and chemical parameters were collected from one or more depths at each sampling station (see maps; pages v, vi, and vii). During each visit, a single depth-integrated (15 feet or near bottom to surface) sample was composited from each of the stations for phytoplankton identification and enumeration; and during the last visit, a single five-gallon depth-integrated sample was composited from each lake for algal assays. Also each time, a depth-integrated sample was collected from each of the stations for chlorophyll a analysis. The maximum depths sampled were 120 feet in Lake Lillinonah, 75 feet in Lake Zoar, and 16 feet in Lake Housatonic.

The results obtained are presented in full in Appendix B, and the data for the fall sampling period, when the lakes essentially were well-mixed, are summarized below. Note, however, the Secchi disc summaries are based on all values.

For differences in the various parameters at the other sampling times, refer to Appendix B.

A. Physical and chemical characteristics:

C. Limiting Nutrient Study:

1. Lake Lillinonah -

a. Autoclaved, filtered, and nutrient spiked -

Spike (mg/l)	Ortho P Conc. (mg/l)	Inorganic N Conc. (mg/l)	Maximum yield (mg/l-dry wt.)
Control	0.023	0.675	12.2
0.006 P	0.029	0.675	13.8
0.012 P	0.035	0.675	16.2
0.024 P	0.047	0.675	18.4
0.060 P	0.083	0.675	23.7
0.060 P + 10.0 N	0.083	10.675	28.7
10.0 N	0.023	10.675	9.9

b. Discussion -

The control yield of the assay alga, Selenastrum capricornutum, indicates that Lake Lillinonah was phosphorus limited at the time of sampling. The addition of phosphorus spikes stimulated additional growth response, but no growth stimulation was noted with the addition of only nitrogen.

The control yield indicates a relatively high capability for maintaining substantial algal growth.

2. Lake Zoar -

a. Autoclaved, filtered, and nutrient spiked -

Spike (mg/l)	Ortho P Conc. (mg/l)	Inorganic N Conc. (mg/l)	Maximum yield (mg/l-dry wt.)
Control	0.027	0.666	8.1
0.006 P	0.033	0.666	11.4
0.012 P	0.039	0.666	14.5
0.024 P	0.051	0.666	17.0
0.060 P	0.087	0.666	20.8
0.060 P + 10.0 N	0.087	10.666	44.0
10.0 N	0.027	10.666	7.5

b. Discussion -

Algal assay results indicate that phosphorus was the nutrient limiting algal growth in Lake Zoar at the time of sampling. The addition of phosphorus spikes stimulated additional growth response, but no growth response was noted with the addition of only nitrogen.

The control yield indicates that the lake waters were capable of maintaining substantial algal growth.

3. Lake Housatonic -

a. Autoclaved, filtered, and nutrient spiked -

Spike (mg/l)	Ortho P Conc. (mg/l)	Inorganic N Conc. (mg/l)	Maximum yield (mg/l-dry wt.)
Control	0.016	0.517	2.9
0.006 P	0.022	0.517	5.2
0.012 P	0.028	0.517	7.6
0.024 P	0.040	0.517	9.5
0.060 P	0.076	0.517	8.8
0.060 P + 10.0 N	0.076	10.517	17.5
10.0 N	0.016	10.517	3.3

b. Discussion -

Algal assay results indicate that phosphorus was the nutrient limiting algal growth in Lake Housatonic at the time of sampling. Incremental spikes with phosphorus stimulated further growth response, but the addition of only nitrogen produced no effect.

The control yield was considerably lower than the one obtained with Zoar and Lillinonah waters.

4. Nutrient losses -

Losses in nitrogen and phosphorus from lake water which occurred between the time of collection and the beginning of the assays are significant for Zoar and Lillinonah but unlikely to have altered the limiting nutrient as the N:P ratios at the time of collection were 22:1 and 16:1, respectively, indicating phosphorus limitation in the lakes as well.

These algal assay data suggest that primary production in the three impoundments studied can be controlled by limiting the phosphorus input.

D. Trophic Condition:

1. Lake Lillinonah -

Lake Lillinonah is a eutrophic water body which exhibits high nutrient levels and severely depressed dissolved oxygen levels. Such impact upon the dissolved oxygen levels, considering high light penetration and weakly-developed stratification, is indicative of very high oxygen demand. Water conditions degenerated substantially from late spring through summer, as reflected by increasing nutrients and turbidity, decreasing dissolved oxygen, and successsion from clean-water algae to a blue-green dominated flora. Improvement in water conditions could be expected with reduction of upstream nutrient discharges; the lake sediments

effectively bind much of the phosphorus load entering the lake even at low dissolved oxygen levels (Frink, 1970).

2. Lake Zoar -

Lake Zoar is a eutrophic water body which did not maintain stratification during the summer of 1972. Deeper waters were quite low in dissolved oxygen. High concentrations of blue-green algae were noted in surface waters. Past studies (Frink, op. cit.) confirm the eutrophic nature of the lake and suggest that major nutrient inputs are identifiable and controllable. While Lake Zoar, as well as Lake Lillinonah upstream, effectively ties up a substantial portion of the phosphorus input, that input is high enough to provide excessively high concentrations at the outlet.

3. Lake Housatonic -

Lake Housatonic is a eutrophic impoundment, heavily weeded in the shallow upper portions, which produced high algae concentrations in summer and fall, 1972. Nutrient levels were consistently high, and dissolved oxygen levels remained below saturation despite turbulent mixing and light penetration approaching the bottom over much of the reach. The short hydraulic retention time and absence of stratification favor recovery if nutrient levels are reduced upstream. Carp activity probably results in considerable resuspension of silts and nutrients within the impoundment.

V. NUTRIENT LOADINGS
(See Appendix C for data)

For the determination of nutrient loadings, the Connecticut National Guard collected monthly near-surface grab samples from each of the tributary sites indicated on the maps (pages v, vi, and vii), except for the high runoff period in the spring when two or more samples a month were collected. Sampling was begun in August, 1972, and was completed in October, 1973.

Through an interagency agreement, stream flow estimates for the year of sampling and a "normalized" or average year were provided by the Connecticut District Office of the U.S. Geological Survey for the tributary sites nearest the lakes. However, through an oversight, flows were not provided for the Pomperaug River; flows and area of this stream were included in "ZZ" (see below).

In this report, nutrient loads for sampled tributaries were determined by using a modification of a U.S. Geological Survey computer program for calculating stream loadings*. The Housatonic River background loading (known point sources subtracted) was computed at the inlet to each lake. These background loadings reflect the impact of significant upstream point sources outside of the Survey area; in 1969, nearly ½ million pounds of phosphorus were reported from Massachusetts point sources alone (Cooperman, et al., 1971).

---

* See Working Paper No. 1.

The nutrient loads shown are those measured minus point sources, if any.

Nutrient loadings for unsampled "minor tributaries and immediate drainage" ("ZZ" of U.S.G.S.) were estimated by using the mean "ZZ" flows and mean concentrations in the Shepaug River for Lake Lillinonah and the Halfway River of lakes Zoar and Housatonic.

Operators of the wastewater treatment plants listed provided monthly effluent samples and corresponding flow data.

A. Waste Sources*:

1. Lake Lillinonah -

a. Known muncipal -

Name	Pop. Served	Treatment	Mean Flow (mgd)	Receiving Water
Bethel	7,000	act. sludge	0.563	Shepaug River
Danbury	29,000	trickling filter	8.610	Limekiln Brook
Kent	900	act. sludge	0.042	Housatonic River
New Milford	4,000	act. sludge	0.512	Housatonic River

b. Known industrial - None

* Armet, 1973.

2. Lake Zoar -

a. Known municipal -

Name	Pop. Served	Treatment	Mean Flow (mgd)	Receiving Water
Heritage Village	5,000	act. sludge + pond	0.432	Pomperaug River
Southbury Train. Sch.	500	trickling filter + sand filter	0.261	Transylvania Brook
Fairfield Hills Hosp. (Newtown)	600	trickling filter + sand filter	0.409	Deep Brook to Pootatuck River

b. Known industrial - None

3. Lake Housatonic -

a. Known municipal - No direct input

b. Known industrial - None

B. Annual Total Phosphorus Loading - Average Year:

1. Lake Lillinonah -

a. Inputs -

Source	lbs P/ yr	% of total
1) Tributaries (non-point load) -		
Housatonic River	392,270	66.2
Shepaug River	23,360	3.9
2) Minor tributaries & immediate drainage (non-point load) -	11,620	2.0
3) Known municipal -		
Bethel	9,610	1.6
Danbury	144,690	24.4
Kent	990	0.2
New Milford	10,130	1.7
4) Septic tanks - Unknown	-	-
5) Known industrial - None	-	-
6) Direct precipitation* -	300	<0.1
Total	592,970	100.0

b. Outputs -

Lake outlet - Housatonic R. 294,160

c. Net annual P accumulation - 298,810 pounds

* See Working Paper No. 1.

2. Lake Zoar -

a. Inputs -

Source	lbs P/ yr	% of total
1) Tributaries (non-point load) -		
Housatonic River	294,160	86.2
Pootatuck River	10,860	3.2

6) Direct precipitation* -	9,390	0.2
Total	6,089,380	100.0

b. Outputs -

Lake outlet - Housatonic R. 5,636,820

c. Net annual N accumulation - 452,560 pounds

* See Working Paper No. 1.

3. Lake Housatonic -

a. Inputs -

Source	lbs N/yr	% of total
1) Tributaries (non-point load) -		
Housatonic River	5,636,820	98.1
2) Minor tributaries & immediate drainage (non-point load) -	108,780	1.9
3) Known municipal - None	-	-
4) Septic tanks - Unknown	-	-
5) Known industrial - None	-	-
6) Direct precipitation* -	3,160	<0.1
Total	5,748,760	100.0

b. Outputs -

Lake outlet - Housatonic R. 5,423,280

c. Net annual N accumulation - 325,480 pounds

* See Working Paper No. 1.

D. Mean Annual Non-point Nutrient Export by Subdrainage Area:

1. Lake Lillinonah -

Tributary	lbs P/mi^2/yr	lbs N/mi^2/yr
Housatonic River	329	4,481
Shepaug River	158	3,834

2. Lake Zoar -

Tributary	lbs P/mi^2/yr	lbs N/mi^2/yr
Housatonic River	211	3,980
Pootatuck River	416	3,570
Halfway River	106	3,256
Kettletown Brook	148	4,884
Unnamed Stream (D-1)	106	3,494
Lee Brook	55	3,945
Boys Halfway River	57	771

3. Lake Housatonic -

Tributary	lbs P/mi^2/yr	lbs N/mi^2/yr
Housatonic River	167	3,658

E. Yearly Loading Rates:

In the following table, the existing phosphorus loading rates are compared to those proposed by Vollenweider (in press). Essentially, his "dangerous" rate is the rate at which the receiving water would become eutrophic or remain eutrophic; his "permissible" rate is that which would result in the receiving water remaining oligotrophic or becoming oligotrophic if morphometry permitted. A mesotrophic rate would be considered one between "dangerous" and "permissible".

Note that Vollenweider's model may not be applicable to water bodies with very short detention times.

1. Lake Lillinonah -

	Total Phosphorus		Total Nitrogen	
Units	Total	Accumulated	Total	Accumulated
lbs/acre/yr	312.1	157.3	3,482.9	567.0
grams/m^2/yr	34.98	17.63	390.4	63.5

Vollenweider loading rates for phosphorus ($g/m^2/yr$) based on mean depth and mean hydraulic retention time of Lake Lillinonah:

"Dangerous" (eutrophic rate)	3.00
"Permissible" (oligotrophic rate)	1.50

2. Lake Zoar -

Units	Total Phosphorus Total	Total Phosphorus Accumulated	Total Nitrogen Total	Total Nitrogen Accumulated
lbs/acre/yr	350.0	86.4	6,245.5	464.2
grams/m^2/yr	39.23	9.69	700.0	52.0

Vollenweider loading rates for phosphorus ($g/m^2/yr$) based on mean depth and mean hydraulic retention time of Lake Zoar:

"Dangerous" (eutrophic rate)	4.40
"Permissible" (oligotrophic rate)	2.20

3. Lake Housatonic -

Units	Total Phosphorus Total	Total Phosphorus Accumulated	Total Nitrogen Total	Total Nitrogen Accumulated
lbs/acre/yr	794.8	125.9	17,526.7	992.3
grams/m^2/yr	89.09	14.11	1,964.5	111.2

Vollenweider loading rates for phosphorus ($g/m^2/yr$) based on mean depth and mean hydraulic retention time of Lake Housatonic:

"Dangerous" (eutrophic rate)	7.60
"Permissible" (oligotrophic rate)	3.80
